vStrap™

Developed for high wind locations

The vStrap has been developed for use in **high wind** locations. The vStrap is designed to transfer any stress from wind or installation to the parallel stakes.

Smaller caliper trees will less likely snap with our vStrap.

Although the vStrap can be used in any application that the Original Treestrap is used, the ingenious pocket that is created with proper installation of the vStrap, will allow new plantings to sway and develop proper strength and growth without constriction.
